

Setting domain name

For registering the cookies, we use the main domain for better accessibility. In some servers, the logic to get the main domain might fail. We highly recommend that you put the domain name in UTM Grabber Setting page as shown below.

The screenshot shows the WordPress dashboard for a site named 'HandL Sandbox'. The left sidebar contains a menu with items like Dashboard, Posts, Media, Pages, Comments, Contact, Appearance, Plugins, Users, Tools, Settings, and WP Mail SMTP. The 'UTM' menu item is highlighted in blue. The main content area is titled 'HandL UTM Grabber' and has three tabs: 'HandL Options' (selected), 'Custom Fields', and 'Predefined Variables'. Under 'HandL Options', there are several settings:

- Append UTM:** A checkbox labeled 'Append UTM variables to all the links automatically (BETA)' is currently unchecked.
- Zapier Webhook URL:** An empty text input field with a 'View Zapier Log (Latest Call Made)' button to its right.
- Cookie Duration:** A text input field containing '30' followed by 'days'.
- Domain:** A text input field containing '.domain.com'. Below it, a note reads: 'If you are using subdomains and lock all the cookies to parent domain. You can do so here. e.g. `.domain.com`'.
- Enable GDPR:** A checkbox labeled 'Check if you'd like to be complaint with EU's GDPR.' is currently unchecked.
- Integromat Webhook URL:** An empty text input field.

At the bottom left of the settings area, there is a blue 'Save Changes' button.
